

Prodibio Stronti+

Strontium is an essential trace element in reef aquariums and is vital for coral development in closed reef tank environments. Strontium also stimulates the growth of hard corals and assists in the development of the red and coralline algae that produce the live rock decor.

STRONTI+ provides all the strontium needed for optimum and healthy coral, clam and coralline algae growth.

The strontium diminishes proportionally with the calcium in a reef aquarium, so you can gauge the strontium demand by examining the calcium content.
