

Ocean Nutrition - Feeding Station (Med)

Feeding Station (Med) Product Description:

The Feeding Station is a unique tool for making the feeding of flake foods and other floating foods more efficient. The Feeding Station floats on the surface of the aquarium water and adheres easily to glass or acrylic surfaces. It provides a stationary zone where fish can return repeatedly to feed while containing floating foods within a limited space. The food does not scatter across the aquarium water surface, which helps to reduce clogging of filters or skimmers.

- Ideal for aquariums equipped with over-flow type set up.
- Reduces waste and therefore has a positive impact on water quality.
- Allows one to target feed slower or weaker fish.

Available Sizes: 1025125, Feeding Station, pack of 1 piece
