

Dymax Calcium MIX XC-600 Calcium Reactor

Â Product Description: Many marine organisms extract calcium from the water in order to build their shell or skeleton. In an aquarium, especially in a reef tank, it is often difficult to keep an acceptable and regular calcium rate. The DYMAX Calcium Mix CX-600 Calcium Reactor is currently one of the most effective means to produce and maintain a permanent optimum rate of calcium. By this innovative system, minimum amount of CO₂ is used and injected into the reactor to produce the optimum diffuse of carbonic gas into water and acidifies the water within the reactor, which hence provides a dissolution of chalky calcium substrate.

- Internal and external use
- Using corrosive free materials
- Easy to install
- Self-siphon
- Using needle wheel technology to dissolve CO₂ * All comes with 1.5kg Calcium Rock
